

Vhois AI

Turning Business Conversations into Actionable Intelligence

Executive Summary

Every day, businesses record thousands of customer calls, sales conversations, support interactions, meetings, and workshops. Yet more than 95% of these conversations are never analyzed.

Traditional transcription tools convert speech into text.

Vhois AI is building a conversation insights platform that turns real-world human conversations into structured, searchable, and actionable business intelligence.

Our platform automatically identifies speakers, understands conversation context, detects customer intent, highlights objections, identifies missed follow-ups, evaluates agent performance, and delivers actionable insights through intuitive dashboards.

Instead of manually reviewing random recordings, organizations gain complete visibility into every conversation.

While the current product focuses on Sales Call Intelligence, the platform is built to expand into customer support, AI voice agents, meetings, and other enterprise conversations. (Enterprise Meetings, Research Interviews, Government Programs, Surveys, Workshops, Conferences, Compliance Monitoring, Healthcare, Education)

The Problem

Every organization generates valuable spoken information every day.

Unfortunately, most of it disappears once the conversation ends.

Common challenges include:

- Large volumes of recorded conversations that are never reviewed
- Valuable customer insights disappear after every call.
- Manual quality audits that cover only a small percentage of interactions
- Missed follow-ups and action items
- Difficulty tracking compliance and process adherence
- Limited visibility into operational performance
- Time-consuming manual documentation

As businesses continue to generate more voice data, converting conversations into business insights has become increasingly important.

While companies know conversations are happening, they rarely know:

- Which customers are ready to buy?
- Which opportunities are being lost?
- Which objections reduce conversions?
- Which follow-ups never happened?

This creates revenue leakage, inconsistent customer experience, and limited visibility into team performance.

Our Solution

Vhois AI transforms every business conversation into structured, searchable, and measurable intelligence.

Using advanced speech recognition, speaker diarization, and AI analysis, the platform automatically delivers:

The platform automatically processes audio and provides:

- AI-powered transcription
- Speaker identification
- Conversation summaries
- Key topics and discussion points
- Customer intent and sentiment
- Action items and follow-ups
- Risk and compliance indicators
- Quality evaluation
- Analytics and dashboards
- Searchable conversation history

This enables organizations to quickly understand conversations instead of listening to hundreds of calls, immediately know where action is required.

How It Works

Step 1- Capture or upload conversations from existing systems.

Step 2- AI processes the audio using speech recognition and speaker identification.

Step 3- The conversation is analyzed to identify important topics, commitments, questions, risks, customer intent, and business signals.

Step 4- Insights are presented through dashboards, reports, and searchable transcripts.

Step 5

Teams take informed actions based on generated recommendations.

Key Capabilities

Speaker Recognition- Understand who said what throughout the conversation.

Conversation Intelligence- Automatically identify key insights, topics, commitments, and outcomes.

Business Analytics- Transform conversations into measurable operational insights.

Quality Monitoring- Evaluate conversations against business standards and best practices.

Search & Discovery- Quickly search across thousands of conversations using natural language.

Reporting- Generate dashboards and actionable reports for leadership teams.

Why Vhois AI is Different

Traditional Transcription	Vhois AI
Speech → Text	Speech → Business Intelligence
Static transcript	Actionable insights
Manual review	Automated quality audits
Limited analytics	Customer intent, objections, coaching, risk detection
Individual recordings	Organization-wide dashboards

Our core differentiator is speaker-aware conversation intelligence, enabling accurate attribution of customer intent, commitments, objections, and compliance to the right speaker.

Business Impact

Organizations using Vhois AI can:

- ✓ Reduce manual QA effort
- ✓ Increase manager visibility
- ✓ Recover missed revenue opportunities
- ✓ Improve agent coaching
- ✓ Identify high-intent customers faster
- ✓ Standardize quality monitoring
- ✓ Turn every conversation into measurable business data

Rather than reviewing random recordings, leaders gain intelligence from every customer interaction.

Our Vision

We believe conversations are one of the largest untapped sources of enterprise knowledge.

Vhois AI is building the intelligence layer that enables organizations to understand, search, analyze, and act on every business conversation.

Whether the conversation happens with a customer, employee, citizen, patient, partner, or stakeholder, our goal is the same:
